High Pressure Cooling Systems

Revolutionary systems for all livestock cooling applications

This is primarily a poultry house cooling system. It has been proven to reduce temperatures by more than 10 degrees centigrade even in the UK. Fresh water is pumped through the stainless steel system at high pressure (70bar) and creates a fog as it enters the building, the effect on temperature is dramatic and instant. In addition to the cooling effect the system can also be used to increase humidity levels for day old birds (crucial but often overlooked), reducing dust and ammonia levels, and pre-soaking the building prior to washing.
